## Abstract

In this paper, we introduce a new kind of closed sets called  $\alpha^*$ -closed sets in a topological space and investigate their properties. These closed sets are compared with the closed sets and the generalized closed sets. We also introduce the  $\alpha^*$ -homeomorphisms and develop their properties by using the  $\alpha^*$ -closed maps and  $\alpha^*$ -continuous maps.

Keywords:  $g$ -closed set;  $g$ -continuous function;  $g$ -irresolute map;  $g$ -homeomorphism.

2010 Mathematics Subject Classification: 54A05; 54C08

## 1 INTRODUCTION

The concept of generalized closed sets called  $g$ -closed sets were introduced by Levine [1] in 1970 and investigated their properties. With the introduction of this generalized closed sets, many authors introduced different type of generalized

closed sets and studied their properties. The  $\omega$ -closed set [2], semi-generalized closed (briefly  $sg$ -closed) set [3], generalized  $\alpha$ -closed (briefly  $g\alpha$ -closed) set [4], regular generalized closed (briefly  $rg$ -closed) set [5], beta weakly generalized closed (briefly  $\beta wg$ -closed) set [6], generalized semi open-closed (briefly  $gso$ -closed) set [7] are

\*Corresponding author: E-mail: kvithy83@gmail.com

some of the generalized closed sets in the literature.

Homeomorphisms are mappings which preserves the topological properties of the given topological spaces. By definition, a homeomorphism between topological spaces  $X$  and  $Y$  is a bijective map  $f : X \rightarrow Y$  when both  $f$  and  $f^{-1}$  are continuous. For the generalization of the notion of homeomorphisms, Maki etal [8] introduced and studied the  $g$ -homeomorphisms and  $gc$ -homeomorphisms between topological spaces. Devi etal [9] introduced and studied  $sg$ -homeomorphisms and  $gs$ -homeomorphisms. Veera kumar [10] introduced and studied  $*g$ -homeomorphisms and  $*gc$ -homeomorphisms. There are some recent researches carried out on generalized homeomorphisms [11,12,13,14,15].

In this paper, we first introduced a new kind of generalized closed sets called the  $\alpha^*$ -closed sets and studied their topological properties. The  $\alpha^*$ -closed sets are compared with the closed sets and the  $g$ -closed sets. We also introduced the  $\alpha^*$ -closed maps and  $\alpha^*$ -continuous maps and investigated their properties. The notion of irresoluteness was introduced by Crossely and Hilderband [16] in 1972 which is independent of continuous maps. In this paper, we introduced the  $\alpha^*$ -irresolute and investigated this with the  $\alpha^*$ -continuous maps. Finally, we define the notion of  $\alpha^*$ -homeomorphism and studied the properties of  $\alpha^*$ -homeomorphism in a general topological space.

## 2 PRELIMINARIES

Throughout this paper, we represent  $X$ ,  $Y$  and  $Z$  as the topological spaces  $(X, \tau)$ ,  $(Y, \sigma)$  and  $(Z, \eta)$  respectively on which no separation axioms are assumed unless otherwise stated. For a subset  $A$  of  $X$ ,  $cl(A)$  denotes the closure of  $A$  and  $int(A)$  denotes the interior of  $A$ .

We recall the following definitions in the topological space  $X$ .

**Definition 2.1.** [1] A subset  $A$  of a space  $X$  is said to be generalized closed ( $g$ -closed) set if  $cl(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $X$ .

**Definition 2.2.** [8] A map  $f : X \rightarrow Y$  is said to be  $g$ -closed map if for each closed set  $F$  in  $X$ ,  $f(F)$  is  $g$ -closed in  $Y$ .

**Definition 2.3.** [17] A map  $f : X \rightarrow Y$  is said to be generalized continuous ( $g$ -continuous) map if  $f^{-1}(V)$  is  $g$ -open in  $X$  for each open set  $V$  in  $Y$ .

**Definition 2.4.** [18] A bijective function  $f : X \rightarrow Y$  is called generalized homeomorphism ( $g$ -homeomorphism) if both  $f$  and  $f^{-1}$  are  $g$ -continuous.

## 3 $\alpha^*$ -CLOSED SET

**Definition 3.1.** A subset  $A$  of a space  $X$  is said to be a  $\alpha^*$ -closed set if  $int(cl(A)) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $X$ .

From the definition, it is clear that every closed set is a  $\alpha^*$ -closed set as well as every  $g$ -closed set is a  $\alpha^*$ -closed set.

**Example 3.1.** Let  $X = \{a, b, c\}$  and  $\tau = \{\phi, \{b\}, \{c\}, \{b, c\}, X\}$  be a topology on  $X$ . Then,  $\phi, \{a\}, \{b\}, \{c\}, \{a, b\}, \{a, c\}$  and  $X$  are the  $\alpha^*$ -closed sets. Moreover,  $\phi, \{a\}, \{a, b\}, \{a, c\}$  and  $X$  are the  $g$ -closed sets.

**Example 3.2.** In  $\mathbb{R}^n$  space with usual topology, every closed interval is a  $\alpha^*$ -closed set.

**Theorem 3.3.** The intersection of two  $\alpha^*$ -closed sets in a space  $X$  is a  $\alpha^*$ -closed set in  $X$ .

*Proof.* Let  $A$  and  $B$  be two  $\alpha^*$ -closed sets. Then,  $int(cl(A)) \subseteq U_1$  and  $int(cl(B)) \subseteq U_2$  whenever  $A \subseteq U_1$  and  $B \subseteq U_2$  for the open sets  $U_1$  and  $U_2$  in  $X$ . Now,  $int(cl(A)) \cap int(cl(B)) \subseteq U_1 \cap U_2$  whenever  $(A \cap B) \subseteq U_1 \cap U_2$  and  $U_1 \cap U_2$  is open in  $X$ . Since  $int(cl(A \cap B)) \subseteq int(cl(A)) \cap int(cl(B))$ ,  $A \cap B$  is a  $\alpha^*$ -closed set in  $X$ .  $\square$

The union of two  $\alpha^*$ -closed sets in a space  $X$  need not be a  $\alpha^*$ -closed set in  $X$ . This can be seen from the following example.

**Example 3.4.** Let  $X = \{a, b, c\}$  and  $\tau = \{\phi, \{a\}, \{c\}, \{a, c\}, X\}$ . Then,  $A = \{a\}$  and  $B = \{c\}$  are  $\alpha^*$ -closed in  $X$ ; but,  $A \cup B = \{a, c\}$  is not a  $\alpha^*$ -closed set in  $X$ .

In general, the collection of all  $\alpha^*$ -closed sets in  $X$  does not form a topology for  $X$  because the arbitrary union of  $\alpha^*$ -closed sets is not a  $\alpha^*$ -closed set in  $X$  as seen in the above example.

**Definition 3.2.** A topological space  $X$  is a  $T_{\alpha^*}$ -space if every  $\alpha^*$ -closed set in  $X$  is a closed set in  $X$ .

**Theorem 3.5.** In  $T_{\alpha^*}$ -space, the finite union of  $\alpha^*$ -closed sets is a  $\alpha^*$ -closed set.

*Proof.* Suppose  $A = \cup_i^n A_i$  is a finite union of  $\alpha^*$ -closed sets in  $T_{\alpha^*}$ -space. Then,

$$A^c = (\cup_i^n A_i)^c = \cap_i^n A_i^c.$$

Since in  $T_{\alpha^*}$  space, every  $\alpha^*$ -closed set is a closed set, so  $A_i^c$  open for each  $i$  and so  $A^c$  is open. Therefore,  $A$  is closed and hence  $\alpha^*$ -closed.  $\square$

## 4 $\alpha^*$ -CLOSED MAP

**Definition 4.1.** A map  $f : X \rightarrow Y$  is said to be  $\alpha^*$ -closed map if for each closed set  $F$  in  $X$ ,  $f(F)$  is a  $\alpha^*$ -closed set in  $Y$ .

**Definition 4.2.** A map  $f : X \rightarrow Y$  is said to be  $\alpha^*$ -open map if for each open set  $U$  in  $X$ ,  $f(U)$  is a  $\alpha^*$ -open set in  $Y$ .

**Definition 4.3.** A map  $f : X \rightarrow Y$  is said to be  $\alpha^*$ -continuous map if  $f^{-1}(V)$  is  $\alpha^*$ -closed in  $X$  for each closed set  $V$  in  $Y$ .

**Definition 4.4.** A map  $f : X \rightarrow Y$  is said to be a  $\alpha^*$ -irresolute if  $f^{-1}(V)$  is a  $\alpha^*$ -closed in  $X$  for each  $\alpha^*$ -closed set  $V$  in  $Y$ .

**Lemma 4.1.** Every closed map is a  $\alpha^*$ -closed map.

*Proof.* Let  $f : X \rightarrow Y$  be a closed map and let  $F$  be a closed set in  $X$ . Then,  $f(F)$  is a closed set in  $Y$  and so  $\alpha^*$ -closed  $Y$ . Thus,  $f$  is a  $\alpha^*$ -closed map.  $\square$

The converse of the above Lemma need not be true in general.

**Example 4.2.** Let  $X = Y = \{a, b, c\}$  and let  $\tau = \{X, \phi, \{a, b\}\}$  and  $\sigma = \{Y, \phi, \{b\}, \{a, c\}\}$  be topologies on  $X$  and  $Y$  respectively. Let  $f(x) = x$  for every  $x$  in  $X$ . Then,  $f$  is a  $\alpha^*$ -closed map. As the image of  $\{c\}$  is not a closed set,  $f$  is not a closed map.

**Remark 4.1.** Every  $g$ -closed map is a  $\alpha^*$ -closed map.

**Lemma 4.3.** If  $f : X \rightarrow Y$  is a  $\alpha^*$ -closed map and if  $A = f^{-1}(B)$  for some closed set  $B$  in  $Y$ , then  $f_A : A \rightarrow Y$  is a  $\alpha^*$ -closed map.

*Proof.* Let  $F$  be a closed set in  $A$ . Then, there is a closed set  $H$  in  $X$  such that  $F = A \cap H$ . Then,  $f_A(F) = f(A \cap H) = f(A) \cap f(H) = B \cap f(H)$ . Now  $f(H)$  is a  $\alpha^*$ -closed set in  $Y$  as  $f$  is a  $\alpha^*$ -closed map. Therefore,  $B \cap f(H)$  is a  $\alpha^*$ -closed set in  $Y$  and so  $f_A$  is a  $\alpha^*$ -closed map.  $\square$

**Theorem 4.4.** Let  $f : X \rightarrow Y$  and  $g : Y \rightarrow Z$  be  $\alpha^*$ -closed maps. If  $f$  is a closed map, then  $g \circ f : X \rightarrow Z$  is a  $\alpha^*$ -closed map.

*Proof.* Let  $F$  be a closed set in  $X$ . Then,  $f(F)$  is a closed set in  $Y$  as  $f$  is a closed map. Then,  $(g \circ f)(F) = g(f(F))$  is a  $\alpha^*$ -closed set in  $Z$  as  $g$  is a  $\alpha^*$ -closed map. Therefore,  $g \circ f$  is a  $\alpha^*$ -closed map.  $\square$

**Lemma 4.5.** If  $f : X \rightarrow Y$  is a  $\alpha^*$ -irresolute, then  $f$  is a  $\alpha^*$ -continuous map.

*Proof.* Let  $F$  be any closed set in  $Y$ . Since every closed set is a  $\alpha^*$ -closed set,  $F$  is a  $\alpha^*$ -closed set in  $Y$ . Since  $f$  is a  $\alpha^*$ -irresolute,  $f^{-1}(F)$  is a  $\alpha^*$ -closed set in  $X$ . Hence,  $f$  is a  $\alpha^*$ -continuous.  $\square$

**Lemma 4.6.** If  $f : X \rightarrow Y$  is a  $\alpha^*$ -continuous map and  $Y$  is a  $T_{\alpha^*}$ -space, then  $f$  is a  $\alpha^*$ -irresolute.

*Proof.* Let  $F$  be a  $\alpha^*$ -closed set in  $Y$ . Since  $Y$  is a  $T_{\alpha^*}$ -space,  $F$  is a closed set. Then,  $f^{-1}(F)$  is a  $\alpha^*$ -closed set in  $X$ . Hence  $f$  is a  $\alpha^*$ -irresolute.  $\square$

**Theorem 4.7.** If  $f : X \rightarrow Y$  is a  $\alpha^*$ -irresolute and  $g : Y \rightarrow Z$  is a  $\alpha^*$ -continuous map, then  $g \circ f : X \rightarrow Z$  is a  $\alpha^*$ -continuous map.

*Proof.* Let  $F$  be a closed set in  $Z$ . Then,  $g^{-1}(F)$  is a  $\alpha^*$ -closed set in  $Y$  as  $g$  is  $\alpha^*$ -continuous. Now  $(g \circ f)^{-1}(F) = f^{-1}(g^{-1}(F))$  is a  $\alpha^*$ -closed set in  $X$  as  $f$  is a  $\alpha^*$ -irresolute. Therefore,  $g \circ f$  is a  $\alpha^*$ -continuous map.  $\square$

**Corollary 4.8.** *If  $f : X \rightarrow Y$  and  $g : Y \rightarrow Z$  are  $\alpha^*$ -continuous maps and  $Y$  is a  $T_{\alpha^*}$ -space, then  $g \circ f$  is a  $\alpha^*$ -continuous map.*

*Proof.* In  $T_{\alpha^*}$ -space, each  $\alpha^*$ -closed set is a closed set, the result is directly follows from theorem 4.2.  $\square$

**Lemma 4.9.** *Every continuous map is a  $\alpha^*$ -continuous map.*

*Proof.* Let  $f : X \rightarrow Y$  be a continuous map and  $G$  be an open set in  $Y$ . Then,  $f^{-1}(G)$  is an open set in  $X$  and hence  $\alpha^*$ -open set in  $X$ . Therefore,  $f$  is a  $\alpha^*$ -continuous map.  $\square$

*Remark 4.2.* Every  $g$ -continuous map is a  $\alpha^*$ -continuous map.

## 5 $\alpha^*$ -HOMEOMORPHISM

**Definition 5.1.** A bijection  $f : X \rightarrow Y$  is called  $\alpha^*$ -homeomorphism when  $f$  is both  $\alpha^*$ -continuous and  $\alpha^*$ -closed map.

**Lemma 5.1.** *Every homeomorphism is a  $\alpha^*$ -homeomorphism.*

*Proof.* Let  $f : X \rightarrow Y$  be a homeomorphism. Then,  $f$  is both continuous and closed. Then, clearly  $f$  is a  $\alpha^*$ -continuous and  $\alpha^*$ -closed. So  $f$  is a  $\alpha^*$ -homeomorphism.  $\square$

**Lemma 5.2.** *Every  $g$ -homeomorphism is a  $\alpha^*$ -homeomorphism.*

*Proof.* Let  $f : X \rightarrow Y$  be a  $g$ -homeomorphism. Then,  $f$  is both  $g$ -continuous and  $g$ -closed. Then, clearly  $f$  is  $\alpha^*$ -continuous and  $\alpha^*$ -closed. So  $f$  is a  $\alpha^*$ -homeomorphism.  $\square$

The converse of the above two lemmas need not be true as seen from the following example.

**Example 5.3.** *Let  $X$  with a topology  $\tau = \{X, \phi, \{a\}, \{a, c\}\}$  and  $Y$  with a topology  $\sigma = \{Y, \phi, \{a\}, \{c\}, \{a, c\}\}$  where  $X = Y = \{a, b, c\}$ . If  $f : X \rightarrow Y$  with  $f(a) = a$ ,  $f(b) = c$  and  $f(c) = b$ . Then,  $f$  is a  $\alpha^*$ -homeomorphism, but not a homeomorphism and also not a  $g$ -homeomorphism as the inverse image of  $\{a, b\}$  in  $Y$  is not closed and also not  $g$ -closed in  $X$ .*

**Theorem 5.4.** *For any bijection  $f : X \rightarrow Y$ , the following statements are equivalent:*

- (a) *the inverse map  $f^{-1} : Y \rightarrow X$  is a  $\alpha^*$ -continuous map,*
- (b)  *$f$  is a  $\alpha^*$ -open map,*
- (c)  *$f$  is a  $\alpha^*$ -closed map.*

*Proof.* Let  $f^{-1} : Y \rightarrow X$  be a  $\alpha^*$ -continuous map and  $G$  be any open set in  $X$ . Then, the inverse image of  $G$  under  $f^{-1}$ ,  $f(G)$ , is  $\alpha^*$ -open in  $Y$  and so  $f$  is a  $\alpha^*$ -open map. Now, let  $f$  be a  $\alpha^*$ -open map and let  $F$  be any closed set in  $X$ . Then,  $F^c$  is open in  $X$  so  $f(F^c)$  is  $\alpha^*$ -open in  $Y$ . But  $f(F^c) = Y \setminus f(F)$  and so  $f(F)$  is  $\alpha^*$ -closed in  $Y$ . Therefore,  $f$  is a  $\alpha^*$ -closed map. Finally, let  $f$  be a  $\alpha^*$ -closed map and let  $F$  be any closed set in  $X$ . Then,  $f(F)$  is  $\alpha^*$ -closed in  $Y$ . But  $f(F)$  is the inverse image of  $F$  under  $f^{-1}$ . Therefore,  $f^{-1}$  is  $\alpha^*$ -continuous.  $\square$

**Theorem 5.5.** *Let  $f : X \rightarrow Y$  be a  $\alpha^*$ -continuous map from a space  $X$  onto a space  $Y$ . Then, the following statements are equivalent:*

- (a)  *$f$  is a  $\alpha^*$ -open map,*
- (b)  *$f$  is a  $\alpha^*$ -homeomorphism,*
- (c)  *$f$  is a  $\alpha^*$ -closed map.*

*Proof.* Assume that  $f$  is a  $\alpha^*$ -open map. Then, clearly  $f$  is a  $\alpha^*$ -homeomorphism. Now, if  $f$  is a  $\alpha^*$ -homeomorphism, then, by definition  $f$  is a  $\alpha^*$ -closed map. Finally, if  $f$  is a  $\alpha^*$ -closed map, then, by Theorem 5.4,  $f$  is a  $\alpha^*$ -open map.  $\square$

The following example shows that, in general, the composition of two  $\alpha^*$ -homeomorphisms need not be a  $\alpha^*$ -homeomorphism.

**Example 5.6.** *Let  $X = Y = Z = \{a, b, c\}$  be topological spaces with  $\tau = \{X, \phi, \{a\}, \{a, b\}\}$ ,  $\sigma = \{Y, \phi, \{a\}, \{c\}, \{a, c\}\}$  and  $\eta = \{Z, \phi, \{a\}, \{b\}, \{a, b\}\}$  respectively. Let  $f : X \rightarrow Y$  with  $f(a) = a$ ,  $f(b) = c$ ,  $f(c) = b$*

and let  $g : Y \rightarrow Z$  with  $g(x) = x$  for each  $x$  in  $Y$ . Then, both  $f$  and  $g$  are  $\alpha^*$ -homeomorphisms, but their composition  $g \circ f : X \rightarrow Z$  is not a  $\alpha^*$ -homeomorphism as  $\{a, c\}$  is closed in  $Z$ , but  $(g \circ f)^{-1}(\{a, c\}) = \{a, b\}$  is not  $\alpha^*$ -closed in  $X$ .

**Theorem 5.7.** Let  $X$  and  $Z$  be any two topological spaces and let  $Y$  be a  $T_{\alpha^*}$ -space. If  $f : X \rightarrow Y$  and  $g : Y \rightarrow Z$  be  $\alpha^*$ -homeomorphisms, then the composition  $g \circ f : X \rightarrow Z$  is a  $\alpha^*$ -homeomorphism.

*Proof.* Let  $F$  be a closed set in  $Z$ . Then,  $g^{-1}(F)$  is a  $\alpha^*$ -closed set in  $Y$  as  $g$  is a  $\alpha^*$ -continuous map. Since  $Y$  is a  $T_{\alpha^*}$ -space,  $g^{-1}(F)$  is a closed set in  $Y$ . Thus  $f^{-1}(g^{-1}(F)) = (g \circ f)^{-1}(F)$  is a  $\alpha^*$ -closed set in  $X$ . Thus  $g \circ f$  is a  $\alpha^*$ -continuous map.

Again, let  $F$  be a closed set in  $X$ . Then,  $f(F)$  is a  $\alpha^*$ -closed set in  $Y$  as  $f$  is a  $\alpha^*$ -closed map. Since  $Y$  is a  $T_{\alpha^*}$ -space,  $f(F)$  is a closed set in  $Y$ . Thus  $g(f(F)) = (g \circ f)(F)$  is a  $\alpha^*$ -closed set in  $Z$ . Thus  $g \circ f$  is a  $\alpha^*$ -closed map. Hence  $g \circ f$  is a  $\alpha^*$ -homeomorphism.  $\square$

## 6 CONCLUSIONS

In this paper, we introduced a new kind of generalized closed sets,  $\alpha^*$ -closed sets, and investigated their properties. The  $\alpha^*$ -closed maps,  $\alpha^*$ -continuous maps and  $\alpha^*$ -irresolutes were also defined and investigated their properties. Finally, the  $\alpha^*$ -homeomorphisms were introduced and their properties were established.
